

δ Ryle

Digital assets infrastructure

Financial infrastructure for the Digital Assets Economy.

*Issue, distribute, and operate digital assets on public chains — with the
modules partners need to go to market.*

What have we built?

360° platform for digital assets

Infrastructure to issue, distribute, and operate digital assets in one stack — adopt only the modules you need.

- Enterprise-grade
- API-first

Modular & scalable products

Blockchain Infrastructure for RWAs, stablecoins, and digital assets, white-label wallet, confidentiality, and back office — independently deployable.

- Interoperable
- Customizable

Security & compliance

Built for demanding regulatory frameworks — roles, audit logs, KYC hooks, and selective disclosure when privacy is required.

- Audit trail
- Policy controls
- MiCA-ready mapping

Fast integration

Cut time-to-market from 18–24 months of custom build to days in sandbox and weeks to a partner-ready pilot.

- Quick deployment
- Proven methodology

Advantages of our solution

–75%

Reduction in go-to-market vs traditional custom build

–60%

Reduction in implementation cost vs multi-vendor stacks

–90%

Costs less than building this stack yourself

Traditional implementation

- ✗ Limited operational know-how in digital assets
- ✗ Limited technical know-how across chain, wallets, and privacy
- ✗ Multiple vendors and incompatible integrations
- ✗ Complex integration with legacy cores
- ✗ Custom development for every module required

Ryle

- ✓ Specialized product guidance and partner onboarding
- ✓ Technical support through sandbox and live promotion
- ✓ One platform for infra, wallet, and confidentiality
- ✓ REST APIs and signed webhooks for existing systems
- ✓ Prebuilt modular products — adopt only what you need

Among the fastest paths in the category

~~18–24 months~~

Days → weeks

Architecture

Integration

Module integration: API

Ryle's modular architecture connects every product surface — and your existing systems — so you can roll out gradually and only what you need.

01

API gateway

Single entry point for issuance, accounts, transfers, disclosures, and webhooks — with auth, access control, and delivery logs.

02

Flexible deployment

Start with blockchain infra, then add white-label wallet and confidentiality when the program is ready — without a rewrite.

03

External connectivity

Secure links to public EVM networks, custody connections, KYC providers, and your core systems via APIs and webhooks.

Suite

Products

The Ryle suite

Four products. One financial stack. Adopt independently or together.

01

Blockchain Infrastructure

Issue, mint, redeem, and operate RWAs, stablecoins, and digital assets on public EVM networks.

Issuance

Reserves

02

White Label Wallet

Branded end-user wallet for holds and transfers — embedded accounts, no seed phrases.

Your Brand

Embedded

03

Confidentiality on Public Chains

Encrypted balances and transfers when privacy matters — disclosure and audit without leaving public rails.

Selective Disclosure

Audit

04

Back Office

Console to manage, control, and supervise digital-asset operations — roles, reporting, and audit.

Dashboard

Operations

Blockchain Infrastructure

The core platform for RWAs, stablecoins, and digital assets — lifecycle, supply, reserves, and settlement on public EVM networks.

Product 01

Issue, mint, redeem, and operate RWAs, stablecoins, and digital assets on public rails.

Partners keep custody; Ryle runs the program rails — Console for ops, APIs for product teams.

Image

Features

- Asset lifecycle — launch, mint, redeem, pause, wind down
- Supply and reserve reconciliation
- Policy controls — holders, caps, allowlists, pauses
- APIs & webhooks for product embedding
- Settlement on Ethereum, Polygon, Base, and more

Image

Benefits

- Launch without assembling a chain stack
- One model across Console and APIs
- Sandbox and live share the same capabilities
- Faster path from pilot to production
- Institutional control without custody through us

White Label Wallet

Optional customer-facing wallet under your brand — hold and move digital assets without seed phrases or building crypto UX in-house.

Product 02

Ship a branded end-user wallet for holds and transfers — configured from the Console.

Banks, fintechs, and platforms distribute digital assets under their look & feel, with the same policy and audit model as the platform.

Features

- Branded in-app holds and transfers
- Per-user embedded EVM wallet on first login
- No seed phrases for end users
- Branding, onboarding, and feature toggles in Console
- Gas sponsorship via Ryle relay under policy

Benefits

- Ship distribution UX in weeks
- Institutional look & feel end to end
- Lower support burden vs self-custody UX
- Same policy and audit model as the platform
- Optional — add when you're ready to distribute

Confidentiality on Public Chains

When transparency is a liability, add encrypted balances and transfers — without leaving public-chain settlement or giving up auditability.

Product 03

*Private by default. Visible by policy.
Auditable always.*

One product in the suite — layer confidentiality on a new asset, an existing one, or a third-party asset you support.

Image

Features

- Encrypted balances, amounts, and counterparties
- Zero-knowledge proofs of transfer validity
- Selective disclosure — scoped, timed, logged
- Proof of reserves without holder exposure
- Immutable, attributed audit log

Image

Benefits

- Public rails without public financial exposure
- Keep EVM liquidity and interoperability
- Satisfy auditors without publishing the ledger
- Private by default, visible by policy
- Adopt only when the use case requires it

Back Office

The Ryle Console — manage, control, and supervise digital-asset operations with security and efficiency built in.

Product 04

End-to-end surface for product configuration, mint/redeem, reporting, and roles.

Ops, treasury, compliance, and leadership run the program from one panel — with real-time visibility and a full audit trail.

Image

Features

- Parametrize digital-asset products and services
- Centralized mint, redeem, transfers, and disclosures
- Reconcile supply against custody reserves
- Multi-user panel with roles & permissions
- Full audit trail and transaction attribution

Image

Benefits

- Optimized day-to-day operations
- Full visibility into program health and metrics
- Alignment with FATF, MiCA, and local expectations
- Fewer errors and lower ops cost via automation
- Decisions grounded in live, attributed data

How engagement works

From discovery to live — pick the products you need, then expand.

1

Discover

Align on use case and which modules to start with

2

Sandbox

Keys, one asset, webhooks — exercise core flows

3

Ready

Roles, custody binding, KYC, operational checks

4

Live

KYB, signers, reserves, production endpoints

5

Scale

Add wallet, confidentiality, more assets

Stakeholders typically involved

Product · Commercial · Compliance / Legal · Treasury / Ops · Engineering

Next steps

We're ready to structure a path that fits your program.

01

Discovery call

Map use case and regulatory posture to the right product mix.

02

Sandbox access

Provision keys and exercise issuance, transfers, and ops end to end.

03

Technical deep dive

Architecture, APIs, and module fit — under NDA as needed.
