

Discovery proposal · Suntory

*Verifiable in public.
Confidential by default.*

Confidential digital asset infrastructure for tokenized stock, supply-chain provenance, and programmable loyalty — private balances and amounts, disclosure only when Suntory chooses.

Where Suntory already is

This is not an introduction to blockchain.

2024 – 2025

Tokenized releases

Premium Malt's, Bowmore 12 and 30, and ARC-54 issued as tokenized bottles with proof of ownership and proof of consumption.

Authenticity

NFC on the seal

A tap verifies origin from the distillery; breaking the seal registers the bottle as opened and triggers a claimable token.

Infrastructure

Public chain and custody

Settlement on a public EVM-compatible network, with licensed institutional custody already contracted for digital assets.

In-house

A real Web3 programme

Proprietary, patent-pending technology built inside Suntory Holdings, with named leadership and a stated portfolio-wide ambition.

We are not proposing to replace any of it. We are proposing the layer it needs in order to extend past collectibles.

The property that makes it work is also the constraint

On a public ledger, “verifiable by anyone” and “readable by anyone” are the same thing.

Holdings are public

A six-figure bottle is permanently attributable to an address, and chain analysis routinely links addresses to people. The most privacy-sensitive customers in the portfolio are the most exposed.

Allocation strategy is public

Mint patterns, release sizes, regional distribution, and how fast a drop clears are readable by any competitor, auctioneer, or reseller with a block explorer.

The consumer signal is shared

The open-and-claim data used for allocation and marketing insight is not proprietary once it is onchain. Suntory pays to generate it; the secondary market reads it for free.

It caps what comes next

Casks, distributor settlement, supplier terms, and sustainability data cannot be published to a transparent ledger. Without confidentiality, the programme stops at collectibles.

Public proof of facts. Confidential proof of values.

Blanket privacy would break the consumer promise. The split is the point.

Stays public

Verifiable by anyone, forever — exactly as it works today.

- **This bottle is authentic**
Origin, distillery, batch, and seal status
- **This release exists at this size**
Total supply of an edition, provable to collectors
- **This cask is real and bonded**
Existence and custody status of the underlying asset
- **This claim is certified**
That an attestation was made by an accredited party

Becomes confidential

Encrypted onchain, disclosed to a named party under scoped, logged policy.

- **Who owns it and how much**
Holder balances, positions, and counterparties
- **What it changed hands for**
Amounts, pricing tiers, and transfer history
- **Commercial terms**
Distributor margins, supplier contracts, financing
- **The operating detail behind a claim**
Plant-level and supplier-level data under the attestation

δ Ryle

Six places where confidentiality changes the answer

01

Tokenized stock

Casks and aging inventory as financeable assets

02

Confidential settlement

Distributor and B2B flows without publishing economics

03

Verifiable claims

Provenance and sustainability, provable without exposure

Where this creates value

TOKENIZED STOCK <i>Casks and aging inventory</i> Fractional cask ownership and warehouse receipts. Existence and total supply are provable to holders and lenders; positions, valuations, and financing terms stay private.	SETTLEMENT <i>Distributor and B2B flows</i> Onchain settlement with distributors and importers without publishing volumes, pricing tiers, or regional margins — disclosable to auditors and tax authorities on request.	SECONDARY MARKET <i>Ownership and resale</i> Continuous provenance and brand royalties across resale, with holder identity and price history confidential instead of broadcast to the auction market.
LOYALTY <i>One programme, many brands</i> Points, access, and redeemable experiences across the portfolio. The outstanding liability is provably reserved for finance; member balances and promo economics are not public.	PROVENANCE <i>Upstream supply chain</i> Lot-level chain of custody for barley, oak, agave, tea, and packaging. Certification is verifiable to buyers and retailers; supplier identity, volumes, and terms are not exposed.	SUSTAINABILITY <i>Water claims, provable</i> Replenishment and Scope 3 claims verifiable to regulators, retailers, and auditors without publishing plant-level operational data in water-stressed regions.

What changes, layer by layer

LAYER	ON A TRANSPARENT LEDGER	WITH RYLE
<i>Bottle authenticity</i>	<i>Public — correctly so</i> Anyone can verify origin, batch, and seal status. This is the consumer promise	<i>Unchanged</i> The NFC and provenance layer keeps working exactly as it does today
<i>Who owns what</i>	<i>Public forever</i> Holder addresses and positions are readable and linkable to identities	<i>Encrypted</i> Balances and counterparties hidden; disclosed to the brand or a regulator by policy
<i>What it traded for</i>	<i>Public</i> Amounts and transfer history exposed to auctioneers, resellers, and competitors	<i>Confidential</i> Amounts encrypted, with proof of one specific settlement provided on request
<i>Supply and backing</i>	<i>Visible but unproven</i> Totals can be counted; that reserves actually back the claim cannot be shown	<i>Provable</i> Proof of reserves and supply reconciliation without revealing any holder
<i>Distributor economics</i>	<i>Not viable</i> Volumes, tiers, and margins cannot be published, so the flow never moves onchain	<i>Private settlement</i> Confidential transfers under policy limits, with scoped disclosure for audit

δ Ryle

What Suntory would actually be using

One platform, three surfaces. Adopt only what the first use case needs.

01

Blockchain Infrastructure

Issue and operate assets end to end

02

Confidentiality Onchain

Private balances with disclosure by policy

03

White Label Wallet

Distribution under Suntory's brands

Deep dive · Solution 01

Blockchain Infrastructure

Issue, manage, and operate tokenized assets on public infrastructure.

Ryle runs the programme infrastructure: a Console for operations, APIs for product teams.

For Suntory

- Casks and aging stock as tokenized inventory
- Warehouse receipts and inventory finance
- Cross-brand loyalty and redeemable points
- Settlement units for distributor flows

Treasury vs supply

Features

- Asset lifecycle: launch, issue, redeem, pause, wind down
- Supply and reserve reconciliation against custody
- Policies for who may hold, limits, and control lists
- Multi-user Console with roles and permissions
- APIs and webhooks into existing Suntory systems
- Immutable audit trail of every privileged action
- Settlement on public EVM-compatible networks

Create Assets

Name and configure your digital asset and deploy it to testnet.

Create asset

Connect your custody

Choose how to hold and sign for assets.

Configure custody

Benefits

- Configure and launch an asset without a custom build
- Sandbox and live share the same capabilities
- Binds to the custody relationship already in place
- Hosting, operations, and updates handled by Ryle
- Institutional control without building the stack in-house
- One audit model across Console, API, and wallet

Confidentiality Onchain

Private balances and transfers on public networks, with disclosure when it is required.

Privacy is the default. Visibility is a deliberate, scoped, logged decision.

For Suntory

- Collector positions kept out of public view
- Distributor volumes and margins confidential
- Cask valuations and financing terms private
- Disclosure to auditors and regulators on request

×

Shield

XUY ▾

\$500

Features

- Encrypted balances, amounts, and counterparties
- Valid transfers proven without revealing values
- Selective disclosure: scoped, time-bounded, logged
- Proof of reserves without exposing holders
- Immutable, attributed audit log

🌐

Local currency

Generating proof... (loading_wasm)

🔗

\$1066,51

Benefits

- Public networks without public financial exposure
- Liquidity and interoperability are retained
- Satisfy auditors without publishing the ledger
- Private by default, visible by policy
- Adopt only where the use case requires it

Deep dive · Solution 03

White Label Wallet

Distribute under Suntory's brands, configured from the Console.

Collectors, members, and trade partners hold and move assets with no crypto complexity.

Distribution

- Web, embedded or standalone
- Native iOS and Android apps
- App Store and Google Play

Features

- Per-user wallet from first access, managed centrally
- Holds, transfers, and balances built in
- No seed phrases or gas handling for end users
- Branding and onboarding per brand, not one generic shell
- KYC and identity hooks into existing providers
- Policies, limits, and allowlists set from the Console

Benefits

- Reach collectors and members without building each screen
- A card-paying customer never has to learn a wallet
- Live under a brand in weeks, not quarters
- Same policy and audit model as the rest of the platform
- Works for consumers and trade partners alike

What is platform, and what is a build

Worth being precise before anything gets scoped.

Available today

Confidential asset infrastructure

Issuance and redemption against reserves, confidential transfers with policy limits, participation and KYC gating, proof of reserves, scoped and logged disclosure, immutable audit log, Console, APIs and webhooks, and an optional branded wallet.

Scoped alongside the platform

Provenance and attestations

Item-level physical traceability and confidential claims — sustainability data, supplier credentials, duty and movement records — sit next to the platform rather than inside it. Delivered as scoped work by a forward-deployed engineer, against the same policy and audit model.

Stays with Suntory

Custody, brand, and compliance

Ryle is a technology provider, not a custodian: it holds no reserves, assets, or wallet keys. The existing custody relationship, the NFC and authenticity stack, the brands, the customer relationships, and the regulatory programme all remain Suntory's.

How we would work together

From one chosen use case to a production pilot, with engineering alongside.

1

Discovery

Weeks 1–2

- Pick one use case with a budget owner
- Walkthrough of Console and APIs
- Confirm chain target and custody binding
- Map disclosure needs with compliance

Who is involved:

Ryle product + Suntory digital innovation

2

Sandbox

Weeks 3–6

- Configure the first asset and policies
- Exercise issue, redeem, and transfer
- Run a real disclosure to an auditor role
- Wire webhooks into existing systems

Who is involved:

Ryle engineering + Suntory engineering

3

Production pilot

Following weeks

- Readiness checklist and signers
- Reserve reconciliation with custody
- First live flows, side by side
- Runbook handover to operations

Who is involved:

Suntory operations + Ryle on support

4

Scale

Next stage

- Extend to a second use case
- Additional brands and markets
- Branded wallet distribution
- Provenance and attestation build

Who is involved:

Ryle product + Suntory leadership

What we would like to understand first

Four questions that decide the shape of everything else.

01

Has exposure come up yet?

Have legal, finance, or the collector side raised the public-ledger visibility, or is the organisation still ahead of that conversation?

02

Which use case has a sponsor?

Casks, distributor settlement, and loyalty each answer to a different budget owner. The one with a real sponsor should go first.

03

Which network, and where?

Ryle settles on public EVM-compatible chains, configured per deployment. Confirming the target network is an early, easy question to close.

04

Who needs to be in the room?

Digital innovation, treasury, and compliance will each see a different half of this. Getting two of the three together shortens the path considerably.
